

Recommended Vaccinations for Dogs

We want your pet to be legal! However, we at Bayview Animal Hospital recommend giving your pet all the vaccinations required to keep them healthy and happy. The following vaccinations are needed yearly:

DHPPB:

DISTEMPER: A viral infection causing vomiting, diarrhea, loss of appetite, weight loss, coughing, tonsillitis and/or chronic low-grade fever.

Hepatitis: A viral infection of the liver causing jaundice.

Parainfluenza: A virus that causes coughing, bronchitis and/or pneumonia.

Parvo Virus: A very serious viral stomach and intestinal flu that causes intense vomiting, diarrhea and dehydration.

Bordetella (Canine Cough): An airborne bacteria that can infect dogs when they are around a large population of other dogs and can cause bronchitis.

RABIES: Rabies vaccinations for adult dogs are good for three years.
